CHECK

Wrenfield Physiotherapy: what we found

We checked the website, the online booking path, the contact forms and the domain's email settings, from outside and without access to any account. Below is each finding with its evidence and its fix, and what we would do first.

Prepared for **Wrenfield Physiotherapy** Three clinics, one website

Checked against the live site on **2 October 2026**

SAMPLE REPORT. WRENFIELD IS A MADE-UP BUSINESS

SUMMARY

What we found

Anyone can send email as the clinic's domain. The contact form asks patients about their symptoms and sends the answers to a shared inbox. Bookings cannot be traced to the ads that paid for them.

2
urgent findings, both fixable without changing the booking system

0
bookings or enquiries the ad account can see

3
places an enquiry can land, with no shared record

FINDINGS

In detail

A Email and trust

URGENT

Anyone can send email as @wrenfield.example

The domain's DMARC policy tells receiving servers to deliver mail that fails its checks, and there is no reporting address. A fake invoice or a fake appointment change "from the clinic" would reach patients' inboxes.

```
_dmarc.wrenfield.example  "v=DMARC1; p=none;"
```

Fix: turn on DMARC reports, confirm every service that sends as the domain, then move the policy to quarantine and reject.

HIGH

The booking system's reminders are not authorised to send as the clinic

The SPF record lists the clinic's mailbox provider and ends. The booking system sends appointment reminders as the clinic's address from its own servers, which the record does not name, so those reminders fail the check.

```
wrenfield.example  "v=spf1 include:_spf.mailhost.example -all"
```

Fix: add the booking system's sending servers to the record, then test a reminder before and after.

B Enquiries and patient data

URGENT

The contact form collects health information and emails it to a shared inbox

The form asks "Describe your symptoms". GDPR Article 9 treats health data as a special category. The answers go by plain email to one inbox that three clinics share, with no record of who read or answered them.

Fix: ask for the reason for the visit at booking, behind the privacy notice, and send every form into one logged record that shows who answered and when.

HIGH

An enquiry can land in three places and none of them knows about the others

Online bookings go to the booking system, contact forms to the shared inbox, and calls to each clinic's phone. Nobody can say how many people asked for an appointment last week, or how many were turned away.

Fix: one enquiry record fed by the form, the booking system and a call log, with a reply tracked against each.

C Measurement

HIGH

The ad account cannot see a single booking

Analytics counts visits. Nothing records a booking made, a form sent or a phone number tapped, so Google Ads is told nothing about which searches produce patients and spends as if none do.

```
Conversion actions in the account: 1, "Page view"
Bookings recorded as conversions: none
```

Fix: record each booking and enquiry as a conversion, through the cookie banner, and send it to the ad account.

MEDIUM

Tracking runs before the visitor answers the cookie banner

The analytics and advertising tags load and set cookies on the first page view. The banner is shown, and its answer changes nothing.

Fix: wire the tags to the banner so they wait for a yes, and test both answers.

D Search and access

MEDIUM

The three clinics share one page title and no structured data

- Each clinic page has the title "Wrenfield Physiotherapy | Home".
- No page tells search engines the clinics' addresses or opening hours in a form they can read.
- Six form fields have no label, so a screen reader announces them as nothing.

The booking system's own pages are its supplier's. Where a fix sits there, we write the change and agree it with them.

WHAT WE WOULD DO

Three pieces of work

Each stands on its own and is priced before work starts.

Fix

Fixed price per item

Fix and secure

The urgent items first, each checked on the live site.

- DMARC reports on, then enforcement
- The booking system authorised to send as the clinic
- The contact form moved behind the privacy notice, into one logged record
- A title, address and hours for each clinic, in structured data
- Labels on every form field

Compliance

Fixed price

The record of processing

What patient data the clinics hold, where it goes and on what basis, written from the systems they run.

- A record of processing for the booking system, the forms and the inbox
- A DPIA where the law asks for one
- A privacy notice that matches what the site does
- Each finding cites the article it comes from

Run

Monthly

Measure and keep it working

Every booking traced to the search or ad that produced it, reported by clinic every week.

- Bookings and enquiries sent to the ad account as conversions
- A weekly report per clinic: enquiries, bookings and what the ads returned
- Tracking checked against live events every month
- The compliance record kept current as systems change

Code we write for you is yours, documented and handed over. Websites and ad accounts are built on your own accounts, in your name.
